### Beskrivelse:

#### *Godox UB-85D Translucent Parabolic 85cm Umbrella*

- Made of white, transparent material
- Parabolic shape for directional control
- Bounce or shoot-through
- Softens and spreads a diffused light
- Improves ambient lighting

The transparent umbrella evenly distributes and diffuses the light from any source: flash lamps, light bulbs or photographic lamps. It is the basic element of the studio's equipment in the field of lighting modification.

#### *Soft light*

The white umbrella disperses the light, making it softer and more natural. It aligns the lighting of the photographed scene, reduces shadows. The umbrella is the simplest and most commonly used light modifier. It takes up little space and it's easy to use.

The transparent umbrellas creates a soft, diffuse light, and the transparent material enables you to use the umbrella as a bounce or a shoot-through light modifier similar to a softbox.
